

# CLIPRAIL WITH LIQUID SCREED

## For Timber Joisted Structures - Product Datasheet

This system is a quick and flexible system, providing an even and effective form of heating within a screeded floor on upper levels. The liquid screed has additional binders and additives to be used on timber joisted structures.

UFH pipework is typically clipped to a vapour barrier sheet and then the liquid screed can be laid to depths as low as 40mm, critically reducing the weight load on supporting structures.

When considering using this system, it is critical to ensure that supporting timber structure has been designed to accommodate the increased weight that is associated with the screed.
