STRUCTURAL SLAB SYSTEM

This system is used where underfloor heating is required to be incorporated into a structural floor build up.

High density flooring insulation panels of the required specification are laid over the complete floor area which is overlaid with a reinforcing mesh. The underfloor heating pipework is then clipped to the mesh.

We recommend that the laying of the screed/concrete process is scheduled to follow shortly after installation to avoid leaving the system vulnerable to damage. If a liquid screed is used, the insulation must be sealed to provide a watertight base.
