# TACKER CLIPS

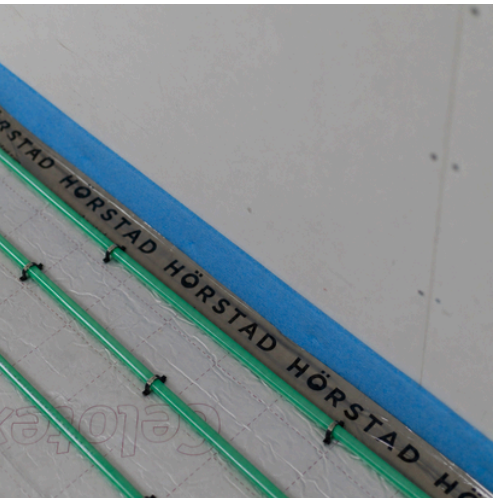

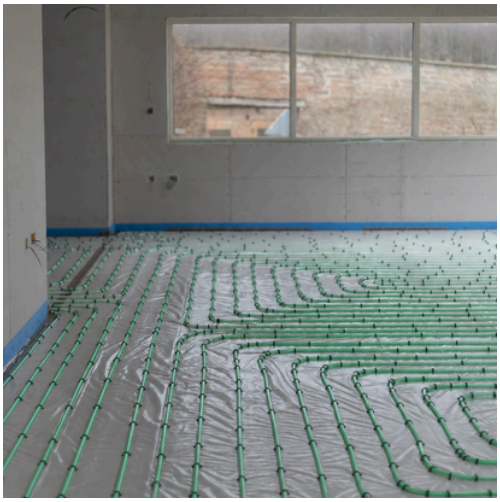

**The tacker clips are used to fasten the underfloor heating pipes to insulation.**
Tacker clips are fed from a specialist tool through into the PIR insulation - these staples are barbed to give a good fixing that will withstand the flex of the pipe.

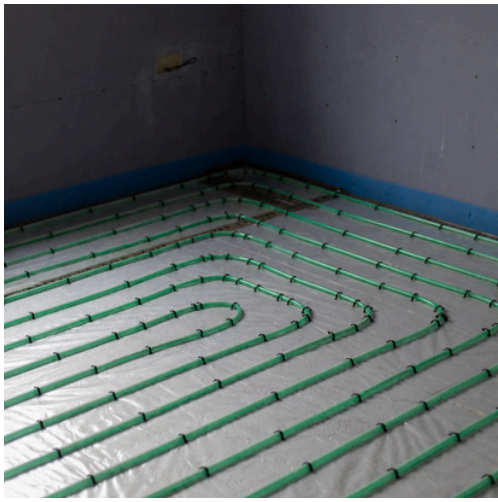

We recommend that the screeding process is scheduled to follow shortly after installation of this system to avoid leaving the system vulnerable to damage. If a liquid screed is used, the insulation must be sealed to provide a watertight base.

Double hooked, taped and welded options available
